FIELD OF THE INVENTION

10 The present invention relates to certain substituted aryl and heteroaryl derivatives that are modulators of glucose metabolism. Accordingly, compounds of the present invention are useful in the treatment of metabolic-related disorders and complications thereof, such as, diabetes and obesity.

BACKGROUND OF THE INVENTION

15 Diabetes mellitus is a serious disease afflicting over 100 million people worldwide. In the United States, there are more than 12 million diabetics, with 600,000 new cases diagnosed each year.

 Diabetes mellitus is a diagnostic term for a group of disorders characterized by abnormal glucose homeostasis resulting in elevated blood sugar. There are many types of diabetes, but the two most common are Type I (also referred to as insulin-dependent diabetes mellitus or IDDM) and Type II (also
20 referred to as non-insulin-dependent diabetes mellitus or NIDDM).

 The etiology of the different types of diabetes is not the same; however, everyone with diabetes has two things in common: overproduction of glucose by the liver and little or no ability to move glucose out of the blood into the cells where it becomes the body's primary fuel.

25 People who do not have diabetes rely on insulin, a hormone made in the pancreas, to move glucose from the blood into the cells of the body. However, people who have diabetes either don't produce insulin or can't efficiently use the insulin they produce; therefore, they can't move glucose into their cells. Glucose accumulates in the blood creating a condition called hyperglycemia, and over time, can cause serious health problems.

30 Diabetes is a syndrome with interrelated metabolic, vascular, and neuropathic components. The metabolic syndrome, generally characterized by hyperglycemia, comprises alterations in carbohydrate, fat and protein metabolism caused by absent or markedly reduced insulin secretion and/or ineffective insulin action. The vascular syndrome consists of abnormalities in the blood vessels leading to cardiovascular, retinal and renal complications. Abnormalities in the peripheral and autonomic nervous systems are also part of the diabetic syndrome.

35 People with IDDM, which accounts for about 5% to 10% of those who have diabetes, don't produce insulin and therefore must inject insulin to keep their blood glucose levels normal. IDDM is characterized by low or undetectable levels of endogenous insulin production caused by destruction of the

insulin-producing β cells of the pancreas, the characteristic that most readily distinguishes IDDM from NIDDM. IDDM, once termed juvenile-onset diabetes, strikes young and older adults alike.

Approximately 90 to 95% of people with diabetes have Type II (or NIDDM). NIDDM subjects produce insulin, but the cells in their bodies are insulin resistant: the cells don't respond properly to the hormone, so glucose accumulates in their blood. NIDDM is characterized by a relative disparity between endogenous insulin production and insulin requirements, leading to elevated blood glucose levels. In contrast to IDDM, there is always some endogenous insulin production in NIDDM; many NIDDM patients have normal or even elevated blood insulin levels, while other NIDDM patients have inadequate insulin production (Rotwein, R. et al. *N. Engl. J. Med.* 308, 65-71 (1983)). Most people diagnosed with NIDDM are age 30 or older, and half of all new cases are age 55 and older. Compared with whites and Asians, NIDDM is more common among Native Americans, African-Americans, Latinos, and Hispanics. In addition, the onset can be insidious or even clinically inapparent, making diagnosis difficult.

The primary pathogenic lesion on NIDDM has remained elusive. Many have suggested that primary insulin resistance of the peripheral tissues is the initial event. Genetic epidemiological studies have supported this view. Similarly, insulin secretion abnormalities have been argued as the primary defect in NIDDM. It is likely that both phenomena are important contributors to the disease process (Rimoin, D. L., et. al. Emery and Rimoin's Principles and Practice of Medical Genetics 3rd Ed. 1:1401-1402 (1996)).

Many people with NIDDM have sedentary lifestyles and are obese; they weigh approximately 20% more than the recommended weight for their height and build. Furthermore, obesity is characterized by hyperinsulinemia and insulin resistance, a feature shared with NIDDM, hypertension and atherosclerosis.

Obesity and diabetes are among the most common human health problems in industrialized societies. In industrialized countries a third of the population is at least 20% overweight. In the United States, the percentage of obese people has increased from 25% at the end of the 1970s, to 33% at the beginning the 1990s. Obesity is one of the most important risk factors for NIDDM. Definitions of obesity differ, but in general, a subject weighing at least 20% more than the recommended weight for his/her height and build is considered obese. The risk of developing NIDDM is tripled in subjects 30% overweight, and three-quarters with NIDDM are overweight.

Obesity, which is the result of an imbalance between caloric intake and energy expenditure, is highly correlated with insulin resistance and diabetes in experimental animals and human. However, the molecular mechanisms that are involved in obesity-diabetes syndromes are not clear. During early development of obesity, increase insulin secretion balances insulin resistance and protects patients from hyperglycemia (Le Stunff, et al. *Diabetes* 43, 696-702 (1989)). However, after several decades, β cell function deteriorates and non-insulin-dependent diabetes develops in about 20% of the obese population (Pederson, P. *Diab. Metab. Rev.* 5, 505-509 (1989)) and (Brancati, F. L., et al., *Arch. Intern. Med.* 159,

957-963 (1999)). Given its high prevalence in modern societies, obesity has thus become the leading risk factor for NIDDM (Hill, J. O., et al., *Science* 280, 1371-1374 (1998)). However, the factors which predispose a fraction of patients to alteration of insulin secretion in response to fat accumulation remain unknown.

- 5 Whether someone is classified as overweight or obese is generally determined on the basis of their body mass index (BMI) which is calculated by dividing body weight (kg) by height squared (m^2). Thus, the units of BMI are kg/m^2 and it is possible to calculate the BMI range associated with minimum mortality in each decade of life. Overweight is defined as a BMI in the range 25-30 kg/m^2 , and obesity as a BMI greater than 30 kg/m^2 (see TABLE below). There are problems with this
- 10 definition in that it does not take into account the proportion of body mass that is muscle in relation to fat (adipose tissue). To account for this, obesity can also be defined on the basis of body fat content: greater than 25% and 30% in males and females, respectively.

15 **CLASSIFICATION OF WEIGHT BY
BODY MASS INDEX (BMI)**

BMI	CLASSIFICATION
< 18.5	Underweight
18.5-24.9	Normal
25.0-29.9	Overweight
30.0-34.9	Obesity (Class I)
35.0-39.9	Obesity (Class II)
>40	Extreme Obesity (Class III)

- As the BMI increases there is an increased risk of death from a variety of causes that is independent of other risk factors. The most common diseases with obesity are cardiovascular disease (particularly hypertension), diabetes (obesity aggravates the development of diabetes), gall bladder
- 20 disease (particularly cancer) and diseases of reproduction. Research has shown that even a modest reduction in body weight can correspond to a significant reduction in the risk of developing coronary heart disease.

- Compounds marketed as anti-obesity agents include Orlistat (XENICALTM) and Sibutramine. Orlistat (a lipase inhibitor) inhibits fat absorption directly and tends to produce a high incidence of
- 25 unpleasant (though relatively harmless) side-effects such as diarrhea. Sibutramine (a mixed 5-HT/noradrenaline reuptake inhibitor) can increase blood pressure and heart rate in some patients. The serotonin releaser/reuptake inhibitors fenfluramine (PondiminTM) and dexfenfluramine (ReduxTM) have been reported to decrease food intake and body weight over a prolonged period (greater than 6 months). However, both products were withdrawn after reports of preliminary evidence of heart

valve abnormalities associated with their use. Accordingly, there is a need for the development of a safer anti-obesity agent.

Obesity considerably increases the risk of developing cardiovascular diseases as well. Coronary insufficiency, atheromatous disease, and cardiac insufficiency are at the forefront of the cardiovascular complication induced by obesity. It is estimated that if the entire population had an ideal weight, the risk of coronary insufficiency would decrease by 25% and the risk of cardiac insufficiency and of cerebral vascular accidents by 35%. The incidence of coronary diseases is doubled in subjects less than 50 years of age who are 30% overweight. The diabetes patient faces a 30% reduced lifespan. After age 45, people with diabetes are about three times more likely than people without diabetes to have significant heart disease and up to five times more likely to have a stroke. These findings emphasize the inter-relations between risks factors for NIDDM and coronary heart disease and the potential value of an integrated approach to the prevention of these conditions based on the prevention of these conditions based on the prevention of obesity (Perry, I. J., et al., *BMJ* 310, 560-564 (1995)).

Diabetes has also been implicated in the development of kidney disease, eye diseases and nervous-system problems. Kidney disease, also called nephropathy, occurs when the kidney's "filter mechanism" is damaged and protein leaks into urine in excessive amounts and eventually the kidney fails. Diabetes is also a leading cause of damage to the retina at the back of the eye and increases risk of cataracts and glaucoma. Finally, diabetes is associated with nerve damage, especially in the legs and feet, which interferes with the ability to sense pain and contributes to serious infections. Taken together, diabetes complications are one of the nation's leading causes of death.

AGONISTS shall mean moieties that interact and activate the receptor, such as the RUP3 receptor and initiates a physiological or pharmacological response characteristic of that receptor. For example, when moieties activate the intracellular response upon binding to the receptor, or enhance GTP
15 binding to membranes.

The term **ANTAGONISTS** is intended to mean moieties that competitively bind to the receptor at the same site as agonists (for example, the endogenous ligand), but which do not activate the intracellular response initiated by the active form of the receptor, and can thereby inhibit the intracellular responses by agonists or partial agonists. Antagonists do not diminish the baseline intracellular response in the absence of an agonist or partial agonist.

Thus, "contacting" a **RUP3** receptor with a compound of the invention includes the administration of a compound of the present invention to an individual, for example a human, having a **RUP3** receptor, as well as, for example, introducing a compound of the invention into a sample containing a cellular or more purified preparation containing a **RUP3** receptor.

IN NEED OF TREATMENT as used herein refers to a judgment made by a caregiver (e.g. physician, nurse, nurse practitioner, etc. in the case of humans; veterinarian in the case of animals, including non-human mammals) that an individual or animal requires or will benefit from treatment. This judgment is made based on a variety of factors that are in the realm of a caregiver's expertise, but that includes the knowledge that the individual is ill, or will be ill, as the result of a disease, condition or disorder that is treatable by the compounds of the invention. The term "treatment" also refers in the alternative to "prophylaxis." Therefore, in general, "in need of treatment" refers to the judgment of the caregiver that the individual is already ill, accordingly, the compounds of the present invention are used to alleviate, inhibit or ameliorate the disease, condition or disorder. Furthermore, the phrase also refers, in the alternative, to the judgment made by the caregiver that the individual will become ill. In this context, the compounds of the invention are used in a protective or preventive manner.

20 **INDIVIDUAL** as used herein refers to any animal, including mammals, preferably mice, rats, other rodents, rabbits, dogs, cats, swine, cattle, sheep, horses, or primates, and most preferably humans.

INHIBIT or **INHIBITING**, in relationship to the term "response" shall mean that a response is decreased or prevented in the presence of a compound as opposed to in the absence of the compound.

INVERSE AGONISTS shall mean moieties that bind the endogenous form of the receptor or to the constitutively activated form of the receptor, and which inhibit the baseline intracellular response initiated by the active form of the receptor below the normal base level of activity which is observed in the absence of agonists or partial agonists, or decrease GTP binding to membranes. Preferably, the baseline intracellular response is inhibited in the presence of the inverse agonist by at least 30%, more preferably by at least 50%, and most preferably by at least 75%, as compared with the baseline response in the absence of the inverse agonist.

35 **LIGAND** shall mean an endogenous, naturally occurring molecule specific for an endogenous, naturally occurring receptor.

As used herein, the terms **MODULATE** or **MODULATING** shall mean to refer to an increase or decrease in the amount, quality, response or effect of a particular activity, function or molecule.

PHARMACEUTICAL COMPOSITION shall mean a composition comprising at least one active ingredient, whereby the composition is amenable to investigation for a specified, efficacious outcome in a mammal (for example, without limitation, a human). Those of ordinary skill in the art will understand and appreciate the techniques appropriate for determining whether an active ingredient has a desired efficacious outcome based upon the needs of the artisan.

THERAPEUTICALLY EFFECTIVE AMOUNT as used herein refers to the amount of active compound or pharmaceutical agent that elicits the biological or medicinal response in a tissue, system, animal, individual or human that is being sought by a researcher, veterinarian, medical doctor or other clinician, which includes one or more of the following:

(1) Preventing the disease; for example, preventing a disease, condition or disorder in an individual that may be predisposed to the disease, condition or disorder but does not yet experience or display the pathology or symptomatology of the disease,

(2) Inhibiting the disease; for example, inhibiting a disease, condition or disorder in an individual that is experiencing or displaying the pathology or symptomatology of the disease, condition or disorder (i.e., arresting further development of the pathology and/or symptomatology), and

(3) Ameliorating the disease; for example, ameliorating a disease, condition or disorder in an individual that is experiencing or displaying the pathology or symptomatology of the disease, condition or disorder (i.e., reversing the pathology and/or symptomatology).

Compounds of the Present Invention:

One aspect of the present invention encompasses certain substituted aryl and heteroaryl derivatives as shown in Formula (I):

or pharmaceutically acceptable salt, solvate, hydrate or N-oxide thereof; wherein Ar, V, Q₁, Q₂, K, E, ---, A₁, A₂, D, W, X, Y, and Z have the same definitions as described herein, *supra* and *infra*.

It is appreciated that certain features of the invention, which are, for clarity, described in the context of separate embodiments, may also be provided in combination in a single embodiment. Conversely, various features of the invention which are, for brevity, described in the context of a single embodiment, may also be provided separately or in any suitable subcombination.

As used herein, "substituted" indicates that at least one hydrogen atom of the chemical group is replaced by a non-hydrogen substituent or group, the non-hydrogen substituent or group can be monovalent or divalent. When the substituent or group is divalent, then it is understood that this group is further substituted with another substituent or group. When a chemical group herein is
5 "substituted" it may have up to the full valance of substitution; for example, a methyl group can be substituted by 1, 2, or 3 substituents, a methylene group can be substituted by 1 or 2 substituents, a phenyl group can be substituted by 1, 2, 3, 4, or 5 substituents, a naphthyl group can be substituted by 1, 2, 3, 4, 5, 6, or 7 substituents and the like. Likewise, "substituted with one or more substituents" refers to the substitution of a group with one substituent up to the total number of substituents
10 physically allowed by the group. Further, when a group is substituted with more than one group they can be identical or they can be different.

It is understood herein that where a moiety is said to be substituted, that moiety is meant to be the one recited in the immediately preceding list of variables. For example, where a C₁₋₆ alkyl group is substituted by a substituent selected from another C₁₋₆ alkyl and other substituents, subsequent
15 language of "wherein C₁₋₆ alkyl is further optionally substituted" refers to the immediately preceding C₁₋₆ alkyl substituent, as opposed to the original C₁₋₆ alkyl group; such that the original C₁₋₆ alkyl can be substituted by another C₁₋₆ alkyl which is itself further optionally substituted.

It is understood and appreciated that compounds of the invention may have one or more chiral centers, and therefore can exist as enantiomers and/or diastereomers. The invention is understood to
20 extend to and embrace all such enantiomers, diastereomers and mixtures thereof, including, but not limited to, racemates. Accordingly, some embodiments of the present invention pertain to compounds of Formula (I) and formulae used throughout this disclosure that are *R* enantiomers. Further, some embodiments of the present invention pertain to compounds of Formula (I) and formulae used throughout this disclosure that are *S* enantiomers. When more than one chiral center is present, for
25 example two chiral centers then, some embodiments of the present invention include compounds that are *RS* or *SR* enantiomers. In further embodiments, compounds of the present invention are *RR* or *SS* enantiomers. General Synthetic Methods

The *de novo* biosynthesis of pyrimidine nucleotides provides essential precursors for multiple growth-related events in higher eukaryotes. Assembled from ATP, bicarbonate and glutamine, the uracil and cytosine nucleotides are fuel for the synthesis of RNA, DNA, phospholipids, UDP sugars and glycogen. Over the past 2 decades considerable progress has been made in elucidating the mechanisms by which cellular pyrimidines are modulated to meet the needs of the cell. These studies point to increasing evidence for cooperation between key cell signaling pathways and basic elements of cellular metabolism, and suggest that these events have the potential to determine distinct cellular fates, including growth, differentiation and death.

As a result of their profound biological significance in higher eukaryotes and utilization of the pyrimidine core in a number of marketed drugs (Scheme 1) and other medicinally relevant

compounds, pyrimidines and pyridines play pivotal roles as chemotypes in drug discovery campaigns. As a direct consequence of this there is a wealth of scientific literature describing synthetic construction, as well as chemical modification and elaboration of these classes of heterocycles.

Scheme 1

The novel substituted pyrimidines and pyridines of the current invention can prepared according to a variety of synthetic manipulations, all of which would be familiar to one skilled in the art of synthetic organic chemistry. Certain methods for the preparation of compounds of the present invention include, but are not limited to, those described in Schemes 2-10 set forth in this section of the specification.

Common dichloro-substituted intermediate 8, used as a starting point for the synthesis of compounds of the present invention can be prepared as depicted in Scheme 2. This is accomplished in two steps from a di-C₁₋₆-alkylmalonate, one particularly useful di-C₁₋₆-alkylmalonate is diethyl malonate 5. Cyclization to the 4,6-dihydroxypyrimidine 7 is achieved by reacting 5 with formamidine in the presence of an alkali metal alkoxide, by mixing the malonate and all or part of the formamidine with the alkoxide or with the alkoxide and the rest of the formamide. Alternative reagents such as dimethylmalonate, sodium methoxide, formamide, in low molecular weight alcoholic solvents, including methanol, ethanol, 2-propanol and the like, may be utilized in the synthesis by heating at a temperature range between about 80 to about 100°C for about 30 mins to about 90 mins followed by a mineral acid work up. Preparation of dihydroxypyrimidines can also be achieved using microorganisms such as *Rhodococcus* (see for reference WO97008152 A1).

Chlorination of the 4 and 6 ring positions to produce intermediate 8 maybe carried out by reacting 7 with a chlorinating reagent, such as, phosgene, POCl₃ (for reference see A. Gomtsyan *et al.*, J. Med. Chem. 2002, 45, 3639–3648), thionyl chloride, oxalyl chloride and by mixtures of the above reagents including PCl₃ / POCl₃ at elevated reaction temperatures.

Scheme 2

- Conventional thermal aromatic substitution reactions of amines and alcohols with halogenated pyrimidines have been well documented (see for example A. G. Arvanitis *et al.*, J. Medicinal Chemistry, 1999, 42, 805–818 and references therein). Nucleophilic aromatic (S_NAr) substitution reactions of electron deficient halogenated pyrimidines are usually rapid and high yielding. However, in certain cases, such as electron rich or neutral halogenated heterocycles, successful substitution is afforded by prolonged heating. To facilitate rapid entry into many of the compounds of the invention microwave synthesis was utilized (Schemes 3 and 4). The Smith synthesizer from Personal Chemistry is a commercially available focussed field heating instrument that provides safer and more uniform conditions for performing the base catalysed substitution reactions depicted in Schemes 3a, 3b and 3c. Bases employed for such conversions (whereby Q₂ = N) include tertiary amines such as triethylamine, Hunig's base (i.e. diisopropyl-ethylamine), N-methylmorpholine and the like. Alternatively, one skilled in the art can employ alkali metal hydrides, alkali metal carbonates (such as, Li₂CO₃, Na₂CO₃, K₂CO₃ and the like), an alkali metal hydrogencarbonate (such as, LiHCO₃, NaHCO₃, KHCO₃ and the like). Wherein Q₂ = N, inert lower alkyl alcoholic solvent can be employed (such as, MeOH, EtOH, i-PrOH, n-BuOH and the like) or wherein Q₂ = O, an ethereal solvent such as tetrahydrofuran, 1,4-dioxane, and the like can be used. Reaction times to access typical intermediates such as 9, 10, and 11, can range from about 300 s to about 3000 s and when conventional thermal methods are employed (wherein Q₂ = O) about 20 mins to about 120 mins.

Scheme 3

Methods for conversion of intermediate monosubstituted pyrimidines and pyridines **9**, **10** and **11** are illustrated in **Scheme 4**. Examples wherein $Q_1 = N$ (**Schemes 4a, 4b, 4c**) were obtained using palladium catalysed aminations. This synthetic strategy has emerged as a powerful tool for synthesis of substituted aryl and heteroaryl anilines in recent times (for reference see S.-L. Buchwald, *Top. Curr. Chem.*, 2002, 219, 131 and references therein). Reaction of a suitably substituted amine (such as, Intermediate **16**) in the presence of a palladium or alternative transition metal catalyst selected from but not limited to $Pd_2(dba)_3$, $Pd(OAc)_2$, CuI , $Cu(OTf)_2$, $Ni(COD)_2$, $Ni(acac)_2$ in a suitable anhydrous solvent (such as, THF, 1,4-dioxane, and the like) with as strong alkali metal alkoxide base (such as, NaO^tBu , KO^tBu and the like). A suitable ligand employed in this step can be selected from BINAP, $P(o\text{-tolyl})_3$, tBu_3P , DPPF, $P[N(^tBu)CH_2CH_3]_3N$ and the like when the catalyst is a palladium derived complex.

Alternatively, for "Ullman-type" aryl aminations catalysed by copper derived complexes the base employed maybe selected from an alkali metal carbonate in an aprotic polar solvent (such as *N,N*-dimethylacetamide, DMF, DMSO, and the like) with L-proline, N-methylglycine or diethylsalicyclamide as the ligand (for reference see D. Ma, *Organic Lett.*, 2003, 5, 14, 2453 – 2455).

Scheme 4

Compounds of general formula 12 to 15 may also be obtained by reversing the order of the reaction steps (i.e. introduction of Q_1 followed by Q_2), wherein the initial step comprises of introduction of either Intermediate 16 or 17 by using base in $i\text{PrOH}$ followed by addition of 4N HCl in dioxane.

As illustrated in Scheme 5, a similar transition metal catalysed couplings were utilized to obtain molecules of general formula 21a and 21b (Scheme 5a) wherein the "Ar" substituent (Hal = Br, I) of intermediate 20 is modified to give analogs with alkyl amino substituents (i.e., NR_aR_b , wherein R_a and R_b are each independently H, C_{1-6} alkyl or a substituted C_{1-6} alkyl, or R_a and R_b together with the nitrogen form a heterocyclic ring, as described herein). Alternatively, the linker atom can be oxygen by utilizing the CuI catalysed method for aromatic C-O formation described by Buchwald (see for reference S. L. Buchwald; Organic Lett., 2002, 4, 6, 973-976) by utilizing, for example, 10 mol% CuI, 20 mol% 1,10-phenanthroline, 2 equivalents of Cs_2CO_3 , at 110 °C for 18 h (Scheme 5b), with an "Ar" iodo substitution in the substrate. One particular embodiment is when the Hal group on "Ar" is substituted at the para position of a phenyl ring.

Scheme 5

A particular substitution for compounds 12, 13, 14, and 15 is wherein $\text{D} = \text{NCOOR}_c$, wherein R_c is C_{1-6} alkyl, or C_{3-7} cycloalkyl and each can be further substituted. Urethanes of this type can be prepared directly from intermediates depicted in Schemes 3 and 4 when $\text{D} = \text{NH}$. In certain reactions, use of a suitable nitrogen protecting group (such as, 'Boc, Cbz, Moz, Alloc, Fmoc and the like) may be necessary during further chemical modification of the core. Deprotection may be achieved using standard reagents familiar to one skilled in the art (these might include TFA, mineral acid, Palladium / hydrogen gas and the like in an alcoholic or ethereal solvent system chosen from methanol, ethanol, *tert*-butanol, THF, 1,4-dioxane, and the like). On occasion wherein the target molecule contains 2 protecting groups, an orthogonal protection strategy may be adopted. The deprotected secondary amine ($\text{D} = \text{NH}$) can subsequently be modified accordingly.

Schemes 6 and 7 illustrate such chemistries wherein generation of a carbamate, urea or amide can be executed using an appropriate reaction in the presence of a base, for example, a tertiary amine base such as TEA, DIEA and the like, in an inert solvent system.

Scheme 9 illustrates the synthesis of ara-alkyl sulfones (27) which are used as aryl building

blocks in **Scheme 4** of the present invention, wherein R_{10} , R_{11} , R_{12} , and R_{13} have the same meaning as described herein. The common methods for preparing these sulfones include the oxidation of sulfides or the sulfonylation of arenes using aryl sulfonyl halides or aryl sulfonic acids in the presence of a strong acid catalyst (see for general reference: the Organic Chemistry of Sulfur; Oae S., Ed.; Plenum Press: New York, 1977). Optimal conversion to the optionally 2,5-disubstituted arene **27** was achieved thermally wherein Hal is preferably iodo using 5 mol % $(\text{CuOTf})_2 \cdot \text{PhH}$ and 10 mol % N,N' -dimethylethylenediamine in DMSO by the method of Wang et al (see for reference Wang Z.; Baskin J. M., Org. Lett., 2002, 4, 25, 4423–4425). In some embodiments, R_{10} and R_{13} are each independently H, halogen, or C_{1-6} alkyl; R_{11} and R_{12} are both H; Hal = Br, I; and $Q_1 = \text{OH}$, or NH_2 .

Scheme 9

Alternative standard organic synthetic methods may be used to introduce alternate substituents in to the Ar component. In one example wherein the linker atom is $Q_1 = \text{N}$, the manipulation maybe carried out by protecting the aniline amino functionality using standard FmocCl and CbzCl protection deprotection steps familiar to one skilled in the art (**Scheme 10**, wherein R_{10} , R_{11} , R_{12} , and R_{13} have the same meaning as described herein) and subsequently using the deprotected aniline in subsequent steps such as those depicted in **Scheme 4**. Nitrile **29**, maybe alternatively transformed in to amidine **A84**, **A90** or **A103** (see Table A) by using hydroxylamine HCl followed by reduction using zinc / acetic acid. In some embodiments of the invention R_{10} is halogen, and R_{13} is H or halogen.

Scheme 10

Synthesis of the 3,5-oxadiazolo variant is depicted in **Scheme 11**. Zinc(II)chloride catalysed

coupling of amidoxime **34** with 4-hydroxypiperidine, CNBr derived **36** yielded building block **37** after acidic workup, which was subsequently utilized in reaction sequences depicted as illustrated in Scheme 3.

Protecting groups may be required for various functionality or functionalities during the synthesis of some of the compounds of the invention. Accordingly, representative protecting groups that are suitable for a wide variety of synthetic transformations are disclosed in Greene and Wuts, *Protective Groups in Organic Synthesis*, 3rd edition, John Wiley & Sons, New York, 1999, the disclosure of which is incorporated herein by reference in its entirety.

The present invention also encompasses diastereomers as well as optical isomers, e.g. mixtures of enantiomers including racemic mixtures, as well as individual enantiomers and diastereomers, which arise as a consequence of structural asymmetry in certain compounds of Formula (I). Separation of the individual isomers or selective synthesis of the individual isomers is accomplished by application of various methods which are well known to practitioners in the art.

INDICATIONS AND METHODS OF TREATMENT

In addition to the foregoing beneficial uses for compounds of the present invention disclosed herein, compounds of the invention are useful in the treatment of additional diseases. Without limitation, these include the following.

The most significant pathologies in Type II diabetes are impaired insulin signaling at its target tissues ("insulin resistance") and failure of the insulin-producing cells of the pancreas to secrete an appropriate degree of insulin in response to a hyperglycemic signal. Current therapies to treat the latter include inhibitors of the β -cell ATP-sensitive potassium channel to trigger the release of endogenous insulin stores, or administration of exogenous insulin. Neither of these achieves accurate normalization of blood glucose levels and both carry the risk of inducing hypoglycemia. For these reasons, there has been intense interest in the development of pharmaceuticals that function in a

glucose-dependent action, i.e. potentiators of glucose signaling. Physiological signaling systems which function in this manner are well-characterized and include the gut peptides GLP1, GIP and PACAP. These hormones act via their cognate G-protein coupled receptor to stimulate the production of cAMP in pancreatic β -cells. The increased cAMP does not appear to result in stimulation of insulin release during the fasting or preprandial state. However, a series of biochemical targets of cAMP signaling, including the ATP-sensitive potassium channel, voltage-sensitive potassium channels and the exocytotic machinery, are modified in such a way that the insulin secretory response to a postprandial glucose stimulus is markedly enhanced. Accordingly, agonists of novel, similarly functioning, β -cell GPCRs, including RUP3, would also stimulate the release of endogenous insulin and consequently promote normoglycemia in Type II diabetes.

It is also established that increased cAMP, for example as a result of GLP1 stimulation, promotes β -cell proliferation, inhibits β -cell death and thus improves islet mass. This positive effect on β -cell mass is expected to be beneficial in both Type II diabetes, where insufficient insulin is produced, and Type I diabetes, where β -cells are destroyed by an inappropriate autoimmune response.

Some β -cell GPCRs, including RUP3, are also present in the hypothalamus where they modulate hunger, satiety, decrease food intake, controlling or decreasing weight and energy expenditure. Hence, given their function within the hypothalamic circuitry, agonists or inverse agonists of these receptors mitigate hunger, promote satiety and therefore modulate weight.

It is also well-established that metabolic diseases exert a negative influence on other physiological systems. Thus, there is often the codevelopment of multiple disease states (e.g. type I diabetes, type II diabetes, inadequate glucose tolerance, insulin resistance, hyperglycemia, hyperlipidemia, hypertriglyceridemia, hypercholesterolemia, dyslipidemia, obesity or cardiovascular disease in "Syndrome X") or secondary diseases which clearly occur secondary to diabetes (e.g. kidney disease, peripheral neuropathy). Thus, it is expected that effective treatment of the diabetic condition will in turn be of benefit to such interconnected disease states.

In some embodiments of the present invention the metabolic-related disorder is hyperlipidemia, type 1 diabetes, type 2 diabetes mellitus, idiopathic type 1 diabetes (Type 1b), latent autoimmune diabetes in adults (LADA), early-onset type 2 diabetes (EOD), youth-onset atypical diabetes (YOAD), maturity onset diabetes of the young (MODY), malnutrition-related diabetes, gestational diabetes, coronary heart disease, ischemic stroke, restenosis after angioplasty, peripheral vascular disease, intermittent claudication, myocardial infarction (e.g. necrosis and apoptosis), dyslipidemia, post-prandial lipemia, conditions of impaired glucose tolerance (IGT), conditions of impaired fasting plasma glucose, metabolic acidosis, ketosis, arthritis, obesity, osteoporosis, hypertension, congestive heart failure, left ventricular hypertrophy, peripheral arterial disease, diabetic retinopathy, macular degeneration, cataract, diabetic nephropathy, glomerulosclerosis, chronic renal failure, diabetic neuropathy, metabolic syndrome, syndrome X, premenstrual syndrome, coronary

heart disease, angina pectoris, thrombosis, atherosclerosis, myocardial infarction, transient ischemic attacks, stroke, vascular restenosis, hyperglycemia, hyperinsulinemia, hyperlipidemia, hypertriglyceridemia, insulin resistance, impaired glucose metabolism, conditions of impaired glucose tolerance, conditions of impaired fasting plasma glucose, obesity, erectile dysfunction, skin and

PHARMACEUTICAL COMPOSITIONS AND SALTS

A further aspect of the present invention pertains to pharmaceutical compositions comprising one or more compounds of Formula (I) or any formula disclosed herein, and one or more pharmaceutically acceptable carriers. Some embodiments of the present invention pertain to pharmaceutical compositions comprising a compound of Formula (I) and a pharmaceutically acceptable carrier.

Some embodiments of the present invention include a method of producing a pharmaceutical composition comprising admixing at least one compound according to any of the compound embodiments disclosed herein and a pharmaceutically acceptable carrier.

Formulations may be prepared by any suitable method, typically by uniformly mixing the active compound(s) with liquids or finely divided solid carriers, or both, in the required proportions, and then, if necessary, forming the resulting mixture into a desired shape.

Conventional excipients, such as binding agents, fillers, acceptable wetting agents, tableting lubricants, and disintegrants may be used in tablets and capsules for oral administration. Liquid preparations for oral administration may be in the form of solutions, emulsions, aqueous or oily suspensions, and syrups. Alternatively, the oral preparations may be in the form of dry powder that can be reconstituted with water or another suitable liquid vehicle before use. Additional additives such as suspending or emulsifying agents, non-aqueous vehicles (including edible oils), preservatives, and flavorings and colorants may be added to the liquid preparations. Parenteral dosage forms may be prepared by dissolving the compound of the invention in a suitable liquid vehicle and filter sterilizing the solution before filling and sealing an appropriate vial or ampoule. These are just a few examples of the many appropriate methods well known in the art for preparing dosage forms.

A compound of the present invention can be formulated into pharmaceutical compositions using techniques well known to those in the art. Suitable pharmaceutically-acceptable carriers, outside those mentioned herein, are known in the art; for example, see Remington, The Science and Practice of Pharmacy, 20th Edition, 2000, Lippincott Williams & Wilkins, (Editors: Gennaro, A. R., et al.).

While it is possible that, for use in the treatment, a compound of the invention may, in an alternative use, be administered as a raw or pure chemical, it is preferable however to present the compound or active ingredient as a pharmaceutical formulation or composition further comprising a pharmaceutically acceptable carrier.

The invention thus further provides pharmaceutical formulations comprising a compound of the invention or a pharmaceutically acceptable salt or derivative thereof together with one or more pharmaceutically acceptable carriers thereof and/or prophylactic ingredients. The carrier(s) must be "acceptable" in the sense of being compatible with the other ingredients of the formulation and not overly deleterious to the recipient thereof.

Pharmaceutical formulations include those suitable for oral, rectal, nasal, topical (including buccal and sub-lingual), vaginal or parenteral (including intramuscular, sub-cutaneous and intravenous) administration or in a form suitable for administration by inhalation, insufflation or by a transdermal patch. Transdermal patches dispense a drug at a controlled rate by presenting the drug for absorption in an efficient manner with a minimum of degradation of the drug. Typically, transdermal patches comprise an impermeable backing layer, a single pressure sensitive adhesive and a removable protective layer with a release liner. One of ordinary skill in the art will understand and appreciate the techniques appropriate for manufacturing a desired efficacious transdermal patch based upon the needs of the artisan.

The compounds of the invention, together with a conventional adjuvant, carrier, or diluent, may thus be placed into the form of pharmaceutical formulations and unit dosages thereof, and in such form may be employed as solids, such as tablets or filled capsules, or liquids such as solutions, suspensions, emulsions, elixirs, gels or capsules filled with the same, all for oral use, in the form of
5 suppositories for rectal administration; or in the form of sterile injectable solutions for parenteral (including subcutaneous) use. Such pharmaceutical compositions and unit dosage forms thereof may comprise conventional ingredients in conventional proportions, with or without additional active compounds or principles, and such unit dosage forms may contain any suitable effective amount of the active ingredient commensurate with the intended daily dosage range to be employed.

10 For oral administration, the pharmaceutical composition may be in the form of, for example, a tablet, capsule, suspension or liquid. The pharmaceutical composition is preferably made in the form of a dosage unit containing a particular amount of the active ingredient. Examples of such dosage units are capsules, tablets, powders, granules or a suspension, with conventional additives such as lactose, mannitol, corn starch or potato starch; with binders such as crystalline cellulose, cellulose
15 derivatives, acacia, corn starch or gelatins; with disintegrators such as corn starch, potato starch or sodium carboxymethyl-cellulose; and with lubricants such as talc or magnesium stearate. The active ingredient may also be administered by injection as a composition wherein, for example, saline, dextrose or water may be used as a suitable pharmaceutically acceptable carrier.

Compounds of the present invention, including pharmaceutically acceptable salts and solvates
20 thereof, can be used as active ingredients in pharmaceutical compositions, specifically as **RUP3** receptor modulators. By the term "active ingredient" is defined in the context of a "pharmaceutical composition" and shall mean a component of a pharmaceutical composition that provides the primary pharmacological effect, as opposed to an "inactive ingredient" which would generally be recognized as providing no pharmaceutical benefit.

25 The dose when using the compounds of the present invention can vary within wide limits, and as is customary and is known to the physician, it is to be tailored to the individual conditions in each individual case. It depends, for example, on the nature and severity of the illness to be treated, on the condition of the patient, on the compound employed or on whether an acute or chronic disease state is treated or prophylaxis is conducted or on whether further active compounds are administered in
30 addition to the compounds of the present invention. Representative doses of the present invention include, but not limited to, about 0.001 mg to about 5000 mg, about 0.001 to about 2500 mg, about 0.001 to about 1000 mg, 0.001 to about 500 mg, 0.001 mg to about 250 mg, about 0.001 mg to 100 mg, about 0.001 mg to about 50 mg, and about 0.001 mg to about 25 mg. Multiple doses may be administered during the day, especially when relatively large amounts are deemed to be needed, for
35 example 2, 3 or 4, doses. Depending on the individual and as deemed appropriate from the patient's physician or care-giver it may be necessary to deviate upward or downward from the doses described herein.

The amount of active ingredient, or an active salt or derivative thereof, required for use in treatment will vary not only with the particular salt selected but also with the route of administration, the nature of the condition being treated and the age and condition of the patient and will ultimately be at the discretion of the attendant physician or clinician. In general, one skilled in the art

5 understands how to extrapolate in vivo data obtained in a model system, typically an animal model, to another, such as a human. Typically, animal models include, but are not limited to, the rodent diabetes model as described in Example 5, *infra* (as well as other animal models known in the art, such as those reported by Reed and Scribner in *Diabetes, Obesity and Metabolism*, 1, 1999, 75-86). In some circumstances, these extrapolations may merely be based on the weight of the animal in the

10 respective model in comparison to another, such as a mammal, preferably a human, however, more often, these extrapolations are not simply based on weights, but rather incorporate a variety of factors. Representative factors include, but not limited to, the type, age, weight, sex, diet and medical condition of the patient, the severity of the disease, the route of administration, pharmacological considerations such as the activity, efficacy, pharmacokinetic and toxicology profiles of the particular

15 compound employed, whether a drug delivery system is utilized, on whether an acute or chronic disease state is being treated or prophylaxis is conducted or on whether further active compounds are administered in addition to the compounds of the Formula (I) and as part of a drug combination. The dosage regimen for treating a disease condition with the compounds and/or compositions of this invention is selected in accordance with a variety of factors as cited above. Thus, the actual dosage

20 regimen employed may vary widely and therefore may deviate from a preferred dosage regimen and one skilled in the art will recognize that dosage and dosage regimen outside these typical ranges can be tested and, where appropriate, may be used in the methods of this invention.

The desired dose may conveniently be presented in a single dose or as divided doses administered at appropriate intervals, for example, as two, three, four or more sub-doses per day. The

25 sub-dose itself may be further divided, e.g., into a number of discrete loosely spaced administrations. The daily dose can be divided, especially when relatively large amounts are administered as deemed appropriate, into several, for example 2, 3 or 4, part administrations. If appropriate, depending on individual behavior, it may be necessary to deviate upward or downward from the daily dose indicated.

30 The compounds of the present invention can be administered in a wide variety of oral and parenteral dosage forms. It will be obvious to those skilled in the art that the following dosage forms may comprise, as the active component, either a compound of the invention or a pharmaceutically acceptable salt of a compound of the invention.

For preparing pharmaceutical compositions from the compounds of the present invention, the

35 selection of a suitable pharmaceutically acceptable carrier can be either solid, liquid or a mixture of both. Solid form preparations include powders, tablets, pills, capsules, cachets, suppositories, and dispersible granules. A solid carrier can be one or more substances which may also act as diluents,

flavouring agents, solubilizers, lubricants, suspending agents, binders, preservatives, tablet disintegrating agents, or an encapsulating material.

In powders, the carrier is a finely divided solid which is in a mixture with the finely divided active component.

5 In tablets, the active component is mixed with the carrier having the necessary binding capacity in suitable proportions and compacted to the desired shape and size.

The powders and tablets may contain varying percentage amounts of the active compound. A representative amount in a powder or tablet may contain from 0.5 to about 90 percent of the active compound; however, an artisan would know when amounts outside of this range are necessary.

10 Suitable carriers for powders and tablets are magnesium carbonate, magnesium stearate, talc, sugar, lactose, pectin, dextrin, starch, gelatin, tragacanth, methylcellulose, sodium carboxymethylcellulose, a low melting wax, cocoa butter, and the like. The term "preparation" is intended to include the formulation of the active compound with encapsulating material as carrier providing a capsule in which the active component, with or without carriers, is surrounded by a carrier, which is thus in
15 association with it. Similarly, cachets and lozenges are included. Tablets, powders, capsules, pills, cachets, and lozenges can be used as solid forms suitable for oral administration.

For preparing suppositories, a low melting wax, such as an admixture of fatty acid glycerides or cocoa butter, is first melted and the active component is dispersed homogeneously therein, as by stirring. The molten homogeneous mixture is then poured into convenient sized molds, allowed to
20 cool, and thereby to solidify.

Formulations suitable for vaginal administration may be presented as pessaries, tampons, creams, gels, pastes, foams or sprays containing in addition to the active ingredient such carriers as are known in the art to be appropriate.

Liquid form preparations include solutions, suspensions, and emulsions, for example, water or
25 water-propylene glycol solutions. For example, parenteral injection liquid preparations can be formulated as solutions in aqueous polyethylene glycol solution. Injectable preparations, for example, sterile injectable aqueous or oleaginous suspensions may be formulated according to the known art using suitable dispersing or wetting agents and suspending agents. The sterile injectable preparation may also be a sterile injectable solution or suspension in a nontoxic parenterally acceptable diluent or
30 solvent, for example, as a solution in 1,3-butanediol. Among the acceptable vehicles and solvents that may be employed are water, Ringer's solution, and isotonic sodium chloride solution. In addition, sterile, fixed oils are conventionally employed as a solvent or suspending medium. For this purpose any bland fixed oil may be employed including synthetic mono- or diglycerides. In addition, fatty acids such as oleic acid find use in the preparation of injectables.

35 The compounds according to the present invention may thus be formulated for parenteral administration (e.g. by injection, for example bolus injection or continuous infusion) and may be presented in unit dose form in ampoules, pre-filled syringes, small volume infusion or in multi-dose

containers with an added preservative. The pharmaceutical compositions may take such forms as suspensions, solutions, or emulsions in oily or aqueous vehicles, and may contain formulatory agents such as suspending, stabilizing and/or dispersing agents. Alternatively, the active ingredient may be in powder form, obtained by aseptic isolation of sterile solid or by lyophilization from solution, for constitution with a suitable vehicle, e.g. sterile, pyrogen-free water, before use.

Aqueous formulations suitable for oral use can be prepared by dissolving or suspending the active component in water and adding suitable colorants, flavours, stabilizing and thickening agents, as desired.

Aqueous suspensions suitable for oral use can be made by dispersing the finely divided active component in water with viscous material, such as natural or synthetic gums, resins, methylcellulose, sodium carboxymethylcellulose, or other well known suspending agents.

Also included are solid form preparations which are intended to be converted, shortly before use, to liquid form preparations for oral administration. Such liquid forms include solutions, suspensions, and emulsions. These preparations may contain, in addition to the active component, colorants, flavors, stabilizers, buffers, artificial and natural sweeteners, dispersants, thickeners, solubilizing agents, and the like.

For topical administration to the epidermis the compounds according to the invention may be formulated as ointments, creams or lotions, or as a transdermal patch.

Ointments and creams may, for example, be formulated with an aqueous or oily base with the addition of suitable thickening and/or gelling agents. Lotions may be formulated with an aqueous or oily base and will in general also contain one or more emulsifying agents, stabilizing agents, dispersing agents, suspending agents, thickening agents, or coloring agents.

Formulations suitable for topical administration in the mouth include lozenges comprising active agent in a flavored base, usually sucrose and acacia or tragacanth; pastilles comprising the active ingredient in an inert base such as gelatin and glycerin or sucrose and acacia; and mouthwashes comprising the active ingredient in a suitable liquid carrier.

Solutions or suspensions are applied directly to the nasal cavity by conventional means, for example with a dropper, pipette or spray. The formulations may be provided in single or multi-dose form. In the latter case of a dropper or pipette, this may be achieved by the patient administering an appropriate, predetermined volume of the solution or suspension. In the case of a spray, this may be achieved for example by means of a metering atomizing spray pump.

Administration to the respiratory tract may also be achieved by means of an aerosol formulation in which the active ingredient is provided in a pressurized pack with a suitable propellant. If the compounds of the Formula (I) or pharmaceutical compositions comprising them are administered as aerosols, for example as nasal aerosols or by inhalation, this can be carried out, for example, using a spray, a nebulizer, a pump nebulizer, an inhalation apparatus, a metered inhaler or a dry powder inhaler. Pharmaceutical forms for administration of the compounds of the Formula (I) as

an aerosol can be prepared by processes well-known to the person skilled in the art. For their preparation, for example, solutions or dispersions of the compounds of the Formula (I) in water, water/alcohol mixtures or suitable saline solutions can be employed using customary additives, for example benzyl alcohol or other suitable preservatives, absorption enhancers for increasing the bioavailability, solubilizers, dispersants and others, and, if appropriate, customary propellants, for example include carbon dioxide, CFC's, such as, dichlorodifluoromethane, trichlorofluoromethane, or dichlorotetrafluoroethane; and the like. The aerosol may conveniently also contain a surfactant such as lecithin. The dose of drug may be controlled by provision of a metered valve.

In formulations intended for administration to the respiratory tract, including intranasal formulations, the compound will generally have a small particle size for example of the order of 10 microns or less. Such a particle size may be obtained by means known in the art, for example by micronization. When desired, formulations adapted to give sustained release of the active ingredient may be employed.

Alternatively the active ingredients may be provided in the form of a dry powder, for example, a powder mix of the compound in a suitable powder base such as lactose, starch, starch derivatives such as hydroxypropylmethyl cellulose and polyvinylpyrrolidone (PVP). Conveniently the powder carrier will form a gel in the nasal cavity. The powder composition may be presented in unit dose form for example in capsules or cartridges of, e.g., gelatin, or blister packs from which the powder may be administered by means of an inhaler.

The pharmaceutical preparations are preferably in unit dosage forms. In such form, the preparation is subdivided into unit doses containing appropriate quantities of the active component. The unit dosage form can be a packaged preparation, the package containing discrete quantities of preparation, such as packeted tablets, capsules, and powders in vials or ampoules. Also, the unit dosage form can be a capsule, tablet, cachet, or lozenge itself, or it can be the appropriate number of any of these in packaged form.

Tablets or capsules for oral administration and liquids for intravenous administration are preferred compositions.

Representative acids include, but are not limited to, acetic, benzenesulfonic, benzoic, camphorsulfonic, citric, ethenesulfonic, dichloroacetic, formic, fumaric, gluconic, glutamic, hippuric, hydrobromic, hydrochloric, isethionic, lactic, maleic, malic, mandelic, methanesulfonic, mucic, nitric, oxalic, pantoic, pantothenic, phosphoric, succinic, sulfiric, tartaric, oxalic, p-toluenesulfonic and the like, such as those pharmaceutically acceptable salts listed in Journal of Pharmaceutical Science, 66, 2 (1977); incorporated herein by reference in its entirety.

The acid addition salts may be obtained as the direct product of compound synthesis. In the alternative, the free base may be dissolved in a suitable solvent containing the appropriate acid, and the salt isolated by evaporating the solvent or otherwise separating the salt and solvent. The compounds of this invention may form solvates with standard low molecular weight solvents using methods known to the skilled artisan.

In addition, compounds according to the invention may optionally exist as pharmaceutically acceptable basic addition salts. For example, these salts can be prepared in situ during the final isolation and purification of the compounds of the invention, or separately by reacting an acidic moiety, such as a carboxylic acid, with a suitable base such as the hydroxide, carbonate or bicarbonate of a pharmaceutically acceptable metal cation or with ammonia, or an organic primary, secondary or tertiary amine. Pharmaceutically acceptable salts include, but are not limited to, cations based on the alkali and alkaline earth metals, such as sodium, lithium, potassium, calcium, magnesium, aluminum salts and the like, as well as nontoxic ammonium, quaternary ammonium, and amine cations, including, but not limited to ammonium, tetramethylammonium, tetraethylammonium, methylamine, dimethylamine, trimethylamine, triethylamine, ethylamine, and the like. Other representative organic amines useful for the formation of base addition salts include diethylamine, ethylenediamine, ethanolamine, diethanolamine, piperazine and the like.

Compounds of the present invention can be converted to "pro-drugs." The term "pro-drugs" refers to compounds that have been modified with specific chemical groups known in the art and when administered into an individual these groups undergo biotransformation to give the parent compound. Pro-drugs can thus be viewed as compounds of the invention containing one or more specialized non-toxic protective groups used in a transient manner to alter or to eliminate a property of the compound. In one general aspect, the "pro-drug" approach is utilized to facilitate oral absorption. A thorough discussion is provided in T. Higuchi and V. Stella, "Pro-drugs as Novel Delivery Systems," Vol. 14 of the A.C.S. Symposium Series; and in Bioreversible Carriers in Drug Design, ed. Edward B. Roche, American Pharmaceutical Association and Pergamon Press, 1987, both of which are hereby incorporated by reference in their entirety.

and niacin), antiplatelet agents (for example, aspirin and adenosine diphosphate receptor antagonists that include: clopidogrel, ticlopidine and the like), angiotensin-converting enzyme inhibitors, angiotensin II receptor antagonists and adiponectin.

5 It is noted that when the **RUP3** receptor modulators are utilized as active ingredients in a pharmaceutical composition, these are not intended for use only in humans, but in other non-human mammals as well. Those of ordinary skill in the art are readily credited with understanding the utility of such compounds in such settings.

Agents in the class also facilitate the regulation of fatty acid metabolism. Examples of PPAR- γ agonists include rosiglitazone, pioglitazone, tesaglitazar, netoglitazone, GW-409544, GW-501516 and PPAR- γ agonists known in

15 at the same time or at different times, or the therapeutic agents can be given as a single composition.

OTHER UTILITIES

Another object of the present invention relates to radio-labeled compounds of Formula (I) that would be useful not only in radio-imaging but also in assays, both in vitro and in vivo, for localizing
20 and quantitating the RUP3 receptor in tissue samples, including human, and for identifying RUP3 receptor ligands by inhibition binding of a radio-labeled compound. It is a further object of this invention to develop novel RUP3 receptor assays of which comprise such radio-labeled compounds.

The present invention embraces isotopically-labeled compounds of Formula (I) and any subgenera herein, such as but not limited to, Formula (Ia) through Formula (IIIo). An "isotopically"
25 or "radio-labeled" compounds are those which are identical to compounds disclosed herein, but for the fact that one or more atoms are replaced or substituted by an atom having an atomic mass or mass number different from the atomic mass or mass number typically found in nature (i.e., naturally occurring). Suitable radionuclides that may be incorporated in compounds of the present invention include but are not limited to ^2H (also written as D for deuterium), ^3H (also written as T for tritium),
30 ^{11}C , ^{13}C , ^{14}C , ^{13}N , ^{15}N , ^{15}O , ^{17}O , ^{18}O , ^{18}F , ^{35}S , ^{36}Cl , ^{82}Br , ^{75}Br , ^{76}Br , ^{77}Br , ^{123}I , ^{124}I , ^{125}I and ^{131}I . The radionuclide that is incorporated in the instant radio-labeled compounds will depend on the specific application of that radio-labeled compound. For example, for in vitro RUP3 receptor labeling and competition assays, compounds that incorporate ^3H , ^{14}C , ^{82}Br , ^{125}I , ^{131}I , ^{35}S or will generally be most useful. For radio-imaging applications ^{11}C , ^{18}F , ^{125}I , ^{123}I , ^{124}I , ^{131}I , ^{75}Br , ^{76}Br or ^{77}Br will generally be
35 most useful.

It is understood that a "radio-labeled" or "labeled compound" is a compound of Formula (I) that has incorporated at least one radionuclide; in some embodiments the radionuclide is selected from the group consisting of ^3H , ^{14}C , ^{125}I , ^{35}S and ^{82}Br .

Certain isotopically-labeled compounds of the present invention are useful in compound and/or substrate tissue distribution assays. In some embodiments the radionuclide ^3H and/or ^{14}C isotopes are useful in these studies. Further, substitution with heavier isotopes such as deuterium (i.e., ^2H) may afford certain therapeutic advantages resulting from greater metabolic stability (e.g., increased in vivo half-life or reduced dosage requirements) and hence may be preferred in some circumstances.

Isotopically labeled compounds of the present invention can generally be prepared by following procedures analogous to those disclosed in the Schemes *supra* and Examples *infra*, by substituting an isotopically labeled reagent for a non-isotopically labeled reagent. Other synthetic methods that are useful are discussed *infra*. Moreover, it should be understood that all of the atoms represented in the compounds of the invention can be either the most commonly occurring isotope of such atoms or the more scarce radio-isotope or nonradio-active isotope.

Synthetic methods for incorporating radio-isotopes into organic compounds are applicable to compounds of the invention and are well known in the art. These synthetic methods, for example, incorporating activity levels of tritium into target molecules, are as follows:

A. Catalytic Reduction with Tritium Gas - This procedure normally yields high specific activity products and requires halogenated or unsaturated precursors.

B. Reduction with Sodium Borohydride [^3H] - This procedure is rather inexpensive and requires precursors containing reducible functional groups such as aldehydes, ketones, lactones, esters, and the like.

C. Reduction with Lithium Aluminum Hydride [^3H] - This procedure offers products at almost theoretical specific activities. It also requires precursors containing reducible functional groups such as aldehydes, ketones, lactones, esters, and the like.

D. Tritium Gas Exposure Labeling - This procedure involves exposing precursors containing exchangeable protons to tritium gas in the presence of a suitable catalyst.

E. N-Methylation using Methyl Iodide [^3H] - This procedure is usually employed to prepare O-methyl or N-methyl (^3H) products by treating appropriate precursors with high specific activity methyl iodide (^3H). This method in general allows for higher specific activity, such as for example, about 70-90 Ci/mmol.

Synthetic methods for incorporating activity levels of ^{125}I into target molecules include:

A. Sandmeyer and like reactions - This procedure transforms an aryl or heteroaryl amine into a diazonium salt, such as a tetrafluoroborate salt, and subsequently to ^{125}I labeled compound using Na^{125}I . A represented procedure was reported by Zhu, D.-G. and co-workers in J. Org. Chem. 2002, 67, 943-948.

B. Ortho ¹²⁵Iodination of phenols – This procedure allows for the incorporation of ¹²⁵I at the ortho position of a phenol as reported by Collier, T. L. and co-workers in J. Labeled Compd Radiopharm. 1999, 42, S264-S266.

5 C. Aryl and heteroaryl bromide exchange with ¹²⁵I – This method is generally a two step process. The first step is the conversion of the aryl or heteroaryl bromide to the corresponding tri-alkyltin intermediate using for example, a Pd catalyzed reaction [i.e. Pd(Ph₃P)₄] or through an aryl or heteroaryl lithium, in the presence of a tri-alkyltinhalide or hexaalkylditin [e.g., (CH₃)₃SnSn(CH₃)₃]. A represented procedure was reported by Bas, M.-D. and co-workers in J. Labeled Compd Radiopharm. 2001, 44, S280-S282.

10 A radio-labeled RUP3 receptor compound of Formula (I) can be used in a screening assay to identify/evaluate compounds. In general terms, a newly synthesized or identified compound (i.e., test compound) can be evaluated for its ability to reduce binding of the “radio-labeled compound of Formula (I)” to the RUP3 receptor. Accordingly, the ability of a test compound to compete with the “radio-labeled compound of Formula (I)” for the binding to the RUP3 receptor directly correlates to
15 its binding affinity.

The labeled compounds of the present invention bind to the RUP3 receptor. In one embodiment the labeled compound has an IC₅₀ less than about 500 μM, in another embodiment the labeled compound has an IC₅₀ less than about 100 μM, in yet another embodiment the labeled compound has an IC₅₀ less than about 10 μM, in yet another embodiment the labeled compound has
20 an IC₅₀ less than about 1 μM, and in still yet another embodiment the labeled inhibitor has an IC₅₀ less than about 0.1 μM.

Other uses of the disclosed receptors and methods will become apparent to those in the art based upon, inter alia, a review of this disclosure.

As will be recognized, the steps of the methods of the present invention need not be
25 performed any particular number of times or in any particular sequence. Additional objects, advantages, and novel features of this invention will become apparent to those skilled in the art upon examination of the following examples thereof, which are intended to be illustrative and not intended to be limiting.

Binding Buffer - filter through 45- micron Nalgene filter and keep in refrigerator. All buffers and membranes should be kept cold (in ice bucket) while performing assay.

20 mM Hepes, pH7.4

1 mM MgCl_2

20 100 mM NaCl

2X Regeneration Buffer (make in binding buffer):

20 mM Phosphocreatine (1.02 gm/200 ml binding buffer)

20 units Creatine phosphokinase (4 mg/200 ml)

25 20 uM GTP (make up 10.46 mg/ml in binding buffer and add 200 ul /200 ml)

0.2 mM ATP (22.04 mg/200 ml)

100 mM IBMX (44.4 mg IBMX dissolved in 1 ml 100% DMSO first and then add the entire amount to 200 ml of buffer).

30 Regeneration buffer can be aliquotted into 40-45 ml portions (in 50 ml sterile tubes) and kept frozen for up to 2 months. Simply put the tube in a beaker with room temperature water to thaw out the regeneration buffer on the day of the assay.

35 A. Assay procedure

1) Pipet 50 ul regeneration buffer in all 96 wells using Matrix 1250 8-channel pipettor.

2) Pipet 5 ul DMSO in columns 1 and columns 11 and 12.

- 3) Pipet 50 ul cAMP standards in columns 11 and 12 in this format: 50 pmole/well for row A, 25 pmole/well for row B, 12.5 pmol/well for row C, 5 picomol/well for row D, 2.5 pmole/well for row E, 1.25 pmole/well for row F, 0.5 pmole/well for row G, and 0 pmole/well (buffer only) for row H.

- 4) Pipet 5 ul compounds from each well of a compound dilution plate, for IC₅₀s, using the following dilution scheme:

Well H: 400 uM compound (final concentration of compound in reaction mix = $5/100 \times 400 \text{ uM} = 20 \text{ uM}$)

Well G: 1:10 dilution of Well H (i.e. 5ul compound from well H + 45 ul 100% DMSO) (final concentration = 2 uM)

Well F: 1:10 dilution of well G (final concentration = 0.2 uM)

Well E: 1:10 dilution of well F (final concentration = 0.02 uM)

Well D: 1:10 dilution of well E (final concentration = 0.002 uM)

Well C: 1:10 dilution of well D (final concentration = 0.0002 uM)

Well B: 1:10 dilution of well C (final concentration = 0.00002 uM)

Well A: 1:10 dilution of well B (final concentration = 0.000002 uM)

IC₅₀s or EC₅₀s are done in triplicate. One Flashplate can therefore be set up to handle 3 compounds. (i.e., columns 2, 3, and 4 are for compound #1, columns 5, 6, and 7 are for compound #2, and columns 8, 9, and 10 are for compound #3.)

- 5) Add 50 ul of RUP3 membranes to all wells in Columns 2 to 10. (Prior to the start of the assay, the frozen membrane pellets for both RUP3 and CMV (cells transfected with an expression plasmid containing no RUP3 sequences), are suspended in binding buffer, usually 1 ml binding buffer for 1 plate of membranes. The membranes are kept in ice all the time, and a polytron (Brinkmann polytron, model # PT-3100) is used (setting 6-7, for 15-20 seconds) to obtain a homogeneous membrane suspension.) Protein concentration is determined by Bradford protein assay kit using instructions given in the kit, using the standard supplied with the kit as a reference. The protein concentration of the membranes is adjusted with binding buffer, so that 50 ul membranes = 15 ug protein (i.e. 0.3 mg/ml protein).

- 6) In column 1, Wells A, B, C, and D, add 50 ul RUP3 membranes. To wells E, F, G, and H, add 50 ul CMV membranes, (CMV membranes being of the same protein concentration as the RUP3 membranes).

7) Incubate 1 hour at room temperature with agitation on a rotating platform shaker. Cover with foil while shaking.

8) After 1 hour, add (to all 96 wells), 100 ul of the ^{125}I tracer in detection buffer supplied with the Flashplate kit plus proclin, made up in the following manner:

Pipet per 10 ml per Flashplate: 100 ml of detection buffer + 1 ml ^{125}I + 0.2 ml of Proclin (the proclin helps to stop the production of cAMP). Make a smaller quantity of detection buffer mix if you have fewer plates.

9) Shake the plates on a rotating platform shaker for 2 hours, covering the plates with lead sheeting.

10) Seal the plates with the plastic film sealers provided with the Flashplate kit.

11) Count the plates using a TRILUX 1450 Microbeta Counter. See the door of the counter to determine which counting protocol to use.

12) Data is analyzed on the Arena Database according to the RUP3 non-fusion, IC_{50} EC_{50} for 96-well cAMP membrane assay, and the compound numbers and the concentrations of compounds must be entered by the user.

B. Membrane Cyclase Criteria

1) Signal to Noise:

An acceptable signal-to-noise ratio for RUP3 can vary from 4 to 6. The raw cpms are approximately 1800 to 2500 for RUP3 and 3500-4500 for CMV. The cpm (or ultimately pmoles of cAMP/well) cannot be outside the standard curve, and should not approach well A of the standard curve (50 pmole/well) and well H (no cAMP). Generally, the pmoles of cAMP produced by RUP3 receptor are around 11 to 13 pmole/well (for 15 ug/well protein), and for CMV are between 2 to 3 pmole/well (for 15 ug protein /well).

2) Standard curve:

The slope should be linear and the error bars for duplicates should be very small. The receptor and CMV controls cannot be off scale of the standard curve, as described above. If the receptor controls are off the high end of the standard curve, i.e. 50 pmole/well or higher, one must repeat the experiment using less protein. However, such a case has not been observed with transiently transfected RUP3 membranes (10 ug DNA/15 cm plate, using 60 ul Lipofectamine, and preparing membranes after 24 hour of transfection.)

- 3) The IC₅₀ or EC₅₀ curve should be at 100% (+ or – 20%) of control RUP3 membranes at the top, and should go down to 0 (or up to 20%) at the bottom. The standard error of the triplicate determinations should be + or – 10%.

C. Stimulation of cAMP in HIT-T15 cells

HIT-T15 (ATCC CRL#1777) is an immortalized hamster insulin-producing cell line. These cells express RUP3 and therefore can be used to assess the ability of RUP3 ligands to stimulate or inhibit cAMP accumulation via its endogenously expressed receptor. In this assay, cells are grown to 80% confluence and then distributed into a 96-well Flashplate (50,000 cells/ well) for detection of cAMP via a “cAMP Flashplate Assay” (NEN, Cat # SMP004). Briefly, cells are placed into anti-cAMP antibody-coated wells that contain either vehicle, the test ligand(s) at a concentration of interest, or 1 uM forskolin. The latter is a direct activator of adenylyl cyclase and serves as a positive control for stimulation of cAMP in HIT-T15 cells. All conditions are tested in triplicate. After a 1 hour incubation to allow for stimulation of cAMP, a Detection Mix containing ¹²⁵I-cAMP is added to each well and the plate is allowed to incubate for another 1 hour. The wells are then aspirated to remove unbound ¹²⁵I-cAMP. Bound ¹²⁵I-cAMP is detected using a Wallac Microbeta Counter. The amount of cAMP in each sample is determined by comparison to a standard curve, obtained by placing known concentrations of cAMP in some wells on the plate.

20

D. Stimulation of insulin secretion in HIT-T15 cells

It is known that stimulation of cAMP in HIT-T15 cells causes an increase in insulin secretion when the glucose concentration in the culture media is changed from 3mM to 15 mM. Thus, RUP3 ligands can also be tested for their ability to stimulate glucose-dependent insulin secretion (GSIS) in HIT-T15 cells. In this assay, 30,000 cells/well in a 12-well plate are incubated in culture media containing 3 mM glucose and no serum for 2 hours. The media is then changed; wells receive media containing either 3 mM or 15 mM glucose, and in both cases the media contains either vehicle (DMSO) or RUP3 ligand at a concentration of interest. Some wells receive media containing 1 uM forskolin as a positive control. All conditions are tested in triplicate. Cells are incubated for 30 minutes, and the amount of insulin secreted into the media is determined by ELISA, using a kit from either Peninsula Laboratories (Cat # ELIS-7536) or Crystal Chem Inc. (Cat # 90060).

25

30

E. Stimulation of insulin secretion in isolated rat islets

As with HIT-T15 cells, it is known that stimulation of cAMP in isolated rat islets causes an increase in insulin secretion when the glucose concentration in the culture media is changed from 60 mg/dl to 300 mg/dl. RUP3 is an endogenously expressed GPCR in the insulin-producing cells of rat

35

islets. Thus, **RUP3** ligands can also be tested for their ability to stimulate GSIS in rat islet cultures.

This assay is performed as follows:

- A. Select 75-150 islet equivalents (IEQ) for each assay condition using a dissecting microscope. Incubate overnight in low-glucose culture medium. (Optional.)
- 5 B. Divide the islets evenly into triplicate samples of 25-40 islet equivalents per sample. Transfer to 40 μ m mesh sterile cell strainers in wells of a 6-well plate with 5 ml of low (60 mg/dl) glucose Krebs-Ringers Buffer (KRB) assay medium.
- C. Incubate 30 minutes (1 hour if overnight step skipped) at 37°C and 5% CO₂. Save the supernatants if a positive control for the RIA is desired.
- 10 D. Move strainers with islets to new wells with 5ml/well low glucose KRB. This is the second pre-incubation and serves to remove residual or carryover insulin from the culture medium. Incubate 30 minutes.
- E. Move strainers to next wells (Low 1) with 4 or 5 ml low glucose KRB. Incubate @ 37°C for 30 minutes. Collect supernatants into low-binding polypropylene tubes pre-labelled for identification and keep cold.
- 15 F. Move strainers to high glucose wells (300mg/dl, which is equivalent to 16.7mM). Incubate and collect supernatants as before. Rinse islets in their strainers in low-glucose to remove residual insulin. If the rinse is to be collected for analysis, use one rinse well for each condition (i.e. set of triplicates.)
- 20 G. Move strainers to final wells with low-glucose assay medium (Low 2). Incubate and collect supernatants as before.
- H. Keeping cold, centrifuge supernatants at 1800 rpm for 5 minutes @ 4-8°C to remove small islets/islet pieces that escape the 40mm mesh. Remove all but lower 0.5 – 1 ml and distribute in duplicate to pre-labelled low-binding tubes. Freeze and store at <-20° C
- 25 I. Insulin determinations are done as above, or by Linco Labs as a custom service, using their rat insulin RIA (Cat. # RI-13K).

Example 2**A. RT-PCR analysis of RUP3 expression in human tissues (Figure 1A).**

RT-PCR was applied to determine the tissue distribution of RUP3. Oligonucleotides used for PCR had the following sequences:

5 ZC47: 5'-CATTGCCGGGCTGTGGTTAGTGTC-3' (forward primer), (SEQ ID NO:3);

ZC48: 5'-GGCATAGATGAGTGGGTTGAGCAG-3' (reverse primer), (SEQ ID NO:4);

and the human multiple tissue cDNA panels (MTC, Clontech) were used as templates (1 ng cDNA per PCR amplification). Twenty-two (22) human tissues were analyzed. PCR was performed using Platinum PCR SuperMix (Life Technologies, Inc.; manufacture instructions were followed) in a
10 50 µl reaction by the following sequences: step 1, 95°C for 4 min; step 2, 95°C for 1 min; step 3, 60°C for 30 sec; step 4, 72°C for 1 min; and step 5, 72°C for 7 min. Steps 2 through 4 were repeated 35 times.

The resulting PCR reactions (15 µl) were loaded on a 1.5% agarose gel to analyze the RT-PCR products, and a specific 466 base-pair DNA fragment representing RUP3 was specifically
15 amplified from cDNA of pancreas origin. Low expression was also evident in subregions of brain.

B. cDNA Dot-Blot analysis of RUP3 expression in human tissues (Figure 1B).

Results from RT-PCR analysis were further confirmed in cDNA dot-blot analysis. In this assay, a dot-blot membrane containing cDNA from 50 human tissues (Clontech) was hybridized with
20 a ³²P-radiolabelled DNA probe having sequences derived from human RUP3. Hybridization signals were seen in pancreas and fetal liver, suggesting these tissues express RUP3. No significant expression was detected in other tissues analyzed.

C. Analysis of RUP3 by RT-PCR with isolated human pancreatic islets of Langerhans (Figure 1C).

Further analysis of RUP3 by RT-PCR with isolated human pancreatic islets of Langerhans showed robust expression of RUP3 in islet cells but not in control samples.

D. Analysis of RUP3 expression with cDNAs of rat origin by RT-PCR (Figure 1D).

30 RUP3 expression was further analyzed with cDNAs of rat origin by RT-PCR technique. Tissue cDNAs used for this assay were obtained from Clontech except those for hypothalamus and islets, which were prepared in house. Concentrations of each cDNA sample were normalized via a control RT-PCR analysis of the house-keeping gene GAPDH before assaying for RUP3 expression. Oligonucleotides used for PCR had the following sequences:

rat RUP3 ("rRUP3") forward: 5'-CATGGGCCCTGCACCTTCTTTG-3' (SEQ ID NO:5);

rRUP3 reverse: 5'-GCTCCGGATGGCTGATGATAGTGA-3' (SEQ ID NO:6).

PCR was performed using Platinum PCR SuperMix (Life Technologies, Inc.; manufacture instructions were followed) in a 50 µl reaction by the following sequences: step 1, 95°C for 4 min; step 2, 95°C for 1 min; step 3, 60°C for 30 sec; step 4, 72°C for 1 min; and step 5, 72°C for 7 min. Steps 2 through 4 were repeated 35 times.

The resulting PCR reactions (15 µl) were loaded on a 1.5% agarose gel to analyze the RT-PCR products, and a specific 547 base-pair DNA fragment representing rat RUP3 was specifically amplified from cDNA of pancreas origin, revealing a similar expression profile with human. Of particular note, robust expression was seen in isolated islets and hypothalamus.

Example 3

RUP3 protein expression is restricted to β cell lineage of pancreatic islets (Figure 2).

A. A polyclonal anti-RUP3 antibody was prepared in rabbits (Figure 2A).

Rabbits were immunized with an antigenic peptide with sequence derived from rat RUP3 ("rRUP3"). The peptide sequence was RGPERTRESAYHIVTISHPELDG (SEQ ID NO: 7) and shared 100% identity with mouse RUP3 in the corresponding region. A cysteine residue was incorporated at the N-terminal end of this antigenic peptide to facilitate KLH crosslinking before injecting into rabbits. The resulting antisera ("anti-rRUP3") and the corresponding preimmune sera ("pre-rRUP3") were tested for immune reactivity to mouse RUP3 in immunoblotting assays (lanes 1 through 4). In this assay, the GST-RUP3 fusion protein was readily recognized by the anti-rRUP3 antisera (lane 4), but not by the preimmune sera (lane 2). The immunoreactive signal could be efficiently eliminated when the immunoblotting assay was performed in the presence of excess antigenic peptide (lane 6).

B. RUP3 expression in insulin-producing β cells of pancreatic islets (Figure 2B).

Rat pancreas was perfused with 4% paraformaldehyde (PFA) in PBS and embedded in OCT embedding medium. Ten micron sections were prepared, fixed on glass slides, and immunostained with either pre-rRUP3 (Figure 2B, panel a) or with anti-rRUP3 antisera (Figure 2B, panels c and e) followed by secondary staining with donkey anti-rabbit IgG conjugated to the fluorochrome Cy-3. Each section was also co-immunostained with a monoclonal anti-insulin antibody (Santa Cruz, Figure 2B, panels b and d) in primary staining followed by a secondary staining with donkey anti-mouse IgG conjugated with FITC, or with a goat anti-glucagon antibody (Santa Cruz, Figure 2B, panel f) and donkey anti-goat IgG coupled to FITC. Immunofluorescent signals were examined under a fluorescent microscope. RUP3 was found expressed in insulin producing cells (panels c and d), but not in glucagons producing cells (panels e and f). These data demonstrated that RUP3 is expressed in

β cells but not in β cells of the rat pancreatic islets. Analogous results were obtained when mouse pancreatic sections were investigated for RUP3 expression.

Example 4

5 Functional Activities of RUP3 *In Vitro* (Figure 3).

It was established that RUP3 stimulates the production of cAMP by cotransfection of 293 cells with: (1) a CRE-Luciferase reporter, wherein the ability to stimulate the production of firefly luciferase depends on increased cAMP in cells, and (2) an expression plasmid encoding the human form of RUP3 (Figure 3A). Note that cells co-transfected with an expression plasmid containing no
10 RUP3 sequences ("CMV" in Figure 3A) produce very little luciferase activity, whereas cells transfected with an expression plasmid encoding RUP3 ("RUP3" in Figure 3A) have at least a 10-fold increase in luciferase activity. This indicates that RUP3 stimulates the production of cAMP when introduced into 293 cells. This property of RUP3 is conserved across species, because hamster RUP3 stimulates luciferase activity when introduced into 293 cells in a manner analogous to that
15 described for human RUP3 (Figure 3B).

It is established that, when cAMP is increased in insulin-producing cells of the pancreas, these cells exhibit an enhanced ability to secrete insulin when glucose concentrations rise. To test whether RUP3 might impart enhanced glucose-dependent insulin release, retrovirus containing human RUP3 was used to generate Tu6 cells that express high levels of RUP3. Tu6 cells produce insulin, but do
20 not express appreciable levels of RUP3 and do not normally exhibit an increase in insulin release when increased glucose is present in the culture media. As shown in Figure 3C, Tu6 cells transduced with a control virus that contains no receptor are still able to produce insulin, but do not show an increase in insulin secretion when the concentration of glucose in the culture media is shifted from 1 mM to 16 mM. By contrast, Tu6 cells transduced with RUP3-containing retrovirus display
25 significant glucose-dependent insulin secretion (Figure 3C).

Example 5

In vivo effects of RUP3 agonists on glucose homeostasis in mice.

30 A. Oral Glucose tolerance test (oGTT)

Male C57bl/6J mice at approximately 8 weeks of age were fasted for 18 hours and randomly grouped (n=5) to receive a RUP3 agonist (either Compound B3 or B124) at 1, 3 or 10 mg/Kg. Compounds were delivered orally via a gavage needle (p.o., volume 10 mL/Kg). At time 0, levels of blood glucose were assessed using a glucometer (Elite XL, Bayer), and mice were administered either
35 vehicle (20% hydroxypropyl-beta-cyclodextrin) or test compound. Thirty minutes after administration of test compound, levels of blood glucose were again assessed, and mice were administered dextrose orally at a dose of 3 g/Kg. Blood glucose measurements were then taken 20 min, 40 min, 60 min and 120 min after this time. Table 6 shows the mean percentage inhibition of

glucose excursion for each dose of test compound, averaged across the five animals in each treatment group. These results demonstrated that the **RUP3** agonists, Compounds B3, and B124, lowered blood glucose in a dose-dependent manner in mice after challenged with glucose.

TABLE 6

Mean % Inhibition of Glucose Excursion

Compound	Dose		
	1 mg/Kg	3 mg/Kg	10 mg/Kg
B3	14.83	22.03	39.31
B124	0	5.49	21.94

Example 6**Generation of Tu6/ RUP3 Stable Lines**

To produce Tu6 cells that express **RUP3** at high levels, a retrovirus bearing an expression cassette for **RUP3** was generated. Briefly, **RUP3** coding sequence was cloned into the retroviral vector pLNCX2 (Clontech, Cat # 6102-1). The amphotropic packaging cell line PT-67 (Clontech, K1060-D) was then transfected with either the parental vector pLNCX2 or pLNCX2/**RUP3** using Lipofectamine and stable lines were established using guidelines provided by the PT-67 vendor. Retrovirus-containing supernatant was obtained by collecting media from the resultant stables according to the manufacturer's directions. Tu6 cells, in a 10 cm dish, were then infected with retrovirus by incubating in a solution of 1 ml viral supernatant/ 9 ml culture media containing 40 ug/ml polybrene for 24 hours. The medium was then changed to culture media containing 300 ug/ml G418. G418-resistant clones were ultimately created by virtue of the neomycin-resistance gene cassette present in the pLNCX2 vector, thus indicating the successful integration of retrovirus into the Tu6 genome. The expression of **RUP3** in the Tu6/**RUP3** G418-resistant colonies was confirmed by Northern blot.

Example 7**Insulin secretion, Tu6 Stables**

To measure insulin secretion from rodent insulin-producing cell lines, cells were first cultured overnight in serum-free, glucose-deficient media. The following morning, the cells were then placed in the same media supplemented with either 1 mM or 16 mM glucose. After an incubation of 4 hours, the media was collected and analyzed for insulin content using a Rat Insulin Enzyme-Immunoassay (EIA) System (Amersham Pharmacia Biotech, Cat. # RPN 2567). Typically, the assay was performed using multiple dilutions of sample media in order to ensure that the sample measurements fell within

the boundaries of the standard curve (generated using known amounts of insulin), as recommended by the manufacturer.

Example 8

5 Receptor Binding Assay

In addition to the methods described herein, another means for evaluating a test compound is by determining binding affinities to the RUP3 receptor. This type of assay generally requires a radiolabelled ligand to the RUP3 receptor. Absent the use of known ligands for the RUP3 receptor and radiolabels thereof, compounds of Formula (I) can be labelled with a radioisotope and used in an
10 assay for evaluating the affinity of a test compound to the RUP3 receptor.

A radiolabelled RUP3 compound of Formula (I) can be used in a screening assay to identify/evaluate compounds. In general terms, a newly synthesized or identified compound (i.e., test compound) can be evaluated for its ability to reduce binding of the "radiolabelled compound of Formula (I)" to the RUP3 receptor. Accordingly, the ability to compete with the "radio-labelled
15 compound of Formula (I)" or Radiolabelled RUP3 Ligand for the binding to the RUP3 receptor directly correlates to its binding affinity of the test compound to the RUP3 receptor.

ASSAY PROTOCOL FOR DETERMINING RECEPTOR BINDING FOR RUP3:

A. RUP3 RECEPTOR PREPARATION

20 293 cells (human kidney, ATCC), transiently transfected with 10 ug human RUP3 receptor and 60 ul Lipofectamine (per 15-cm dish), were grown in the dish for 24 hours (75% confluency) with a media change and removed with 10 ml/dish of Hepes-EDTA buffer (20mM Hepes + 10 mM EDTA, pH 7.4). The cells were then centrifuged in a Beckman Coulter centrifuge for 20 minutes, 17,000 rpm (JA-25.50 rotor). Subsequently, the pellet was resuspended in 20 mM Hepes + 1 mM
25 EDTA, pH 7.4 and homogenized with a 50- ml Dounce homogenizer and again centrifuged. After removing the supernatant, the pellets were stored at -80°C, until used in binding assay. When used in the assay, membranes were thawed on ice for 20 minutes and then 10 mL of incubation buffer (20 mM Hepes, 1 mM MgCl₂, 100 mM NaCl, pH 7.4) added. The membranes were then vortexed to resuspend the crude membrane pellet and homogenized with a Brinkmann PT-3100 Polytron
30 homogenizer for 15 seconds at setting 6. The concentration of membrane protein was determined using the BRL Bradford protein assay.

B. BINDING ASSAY

For total binding, a total volume of 50ul of appropriately diluted membranes (diluted in assay
35 buffer containing 50mM Tris HCl (pH 7.4), 10mM MgCl₂, and 1mM EDTA; 5-50ug protein) is added to 96-well polypropylene microtiter plates followed by addition of 100ul of assay buffer and 50ul of Radiolabelled RUP3 Ligand. For nonspecific binding, 50 ul of assay buffer is added instead of

100ul and an additional 50ul of 10uM cold **RUP3** is added before 50ul of **Radiolabelled RUP3**
Ligand is added. Plates are then incubated at room temperature for 60-120 minutes. The binding
reaction is terminated by filtering assay plates through a Microplate Devices GF/C Unifilter filtration
plate with a Brandell 96-well plate harvester followed by washing with cold 50 mM Tris HCl, pH 7.4
5 containing 0.9% NaCl. Then, the bottom of the filtration plate are sealed, 50ul of Optiphase
Supermix is added to each well, the top of the plates are sealed, and plates are counted in a Trilux
MicroBeta scintillation counter. For compound competition studies, instead of adding 100ul of assay
buffer, 100ul of appropriately diluted test compound is added to appropriate wells followed by
addition of 50 ul of **Radiolabelled RUP3 Ligand**.

10 C. CALCULATIONS

The test compounds are initially assayed at 1 and 0.1 μ M and then at a range of
concentrations chosen such that the middle dose would cause about 50% inhibition of a **Radio-RUP3**
Ligand binding (i.e., IC_{50}). Specific binding in the absence of test compound (B_0) is the difference of
15 total binding (B_T) minus non-specific binding (NSB) and similarly specific binding (in the presence of
test compound) (B) is the difference of displacement binding (B_D) minus non-specific binding (NSB).
 IC_{50} is determined from an inhibition response curve, logit-log plot of % B/B_0 vs concentration of test
compound.

K_i is calculated by the Cheng and Prustoff transformation:

$$20 \quad K_i = IC_{50} / (1 + [L]/K_D)$$

where $[L]$ is the concentration of a **Radio-RUP3 Ligand** used in the assay and K_D is the
dissociation constant of a **Radio-RUP3 Ligand** determined independently under the same binding
conditions.

Step 1: Preparation of 4-(6-chloro-pyrimidin-4-yloxy)-piperidine-1-carboxylic acid tert-butyl ester.

4-Hydroxy-piperidine-1-carboxylic acid tert-butyl ester (46mmol, 1.3eq) and NaH (92mmole, 2eq, 60% in mineral oil) were dissolved in THF (30ml) under N_2 and stirred at 60°C for 40 minutes then 4, 6-dichloropyrimidine (5.237g, 35.4mmole) was added into the solution dropwise. The reaction mixture was stirred at room temp for another 20minutes. The reaction was quenched with water, extracted with ethyl acetate, and concentrated in vacuo, and purified by flash column (Hexane : Ethyl Acetate= 2:1, Rf=0.48) to provide 4-(6-chloro-pyrimidin-4-yloxy)-piperidine-1-carboxylic acid tert-butyl ester as a yellow oil (3.236 g, 29 %). Exact mass calculated for $C_{14}H_{20}ClN_3O_3$ 313.1, found 314.2 (MH^+).

Step 2: Preparation of 2-fluoro-4-(methanesulfonyl)aniline.

To a solution of 2-fluoro-4-iodoaniline (206.8 g, 872.3 mmol) in DMSO (1.1 L), was added by the sequential addition of copper (II) trifluoromethanesulfonate-benzene complex (30.74 g, 61.1 mmol), sodium methanesulfinate (106.9 g, 1.047 mol), and *N,N*-dimethylethylenediamine (13.2 mL, 122 mmol). The reaction vessel was then placed in a preheated oil bath at 120 °C and stirred overnight. After cooling to room temperature, the reaction was diluted with water and extracted repeatedly with EtOAc. The combined organic extract was rinsed with brine (5X), dried over $MgSO_4$, and the solvent was removed. The resulting purple solid was rinsed with diisopropyl ether, then dried to constant weight in a vacuum oven at room temperature overnight to furnish a dull purple solid

Sodium bicarbonate (840 g, 10 mmol) was added via the powder funnel while stirring, then water (ca. 300-400 mL) was gradually added while vigorously stirring to form a thick, uniform slurry. The flask was then placed in an ice bath, and a solution of 4-hydroxypiperidine
10 (506 g, 5.00 mol) in CH_2Cl_2 (1.0 L) was added, and the contents were vigorously mixed while cooling. A solution of cyanogen bromide (640 g, 6.0 mol) in CH_2Cl_2 (600 mL) was added in a dropwise fashion over 2 h, and stirring was continued for an additional 30 min. The ice bath was removed, and the mechanical stirrer was replaced by a magnetic stirrer, and the reaction mixture was stirred for 16 h. The flask was once again placed under mechanical stirring, and sodium carbonate
15 (100 g) was added in order to ensure complete neutralization. MgSO_4 (500 g) was added, and vigorous stirring was continued for 15 min. The resulting suspension was filtered, rinsing with CH_2Cl_2 (2.0 L). A light amber, viscous oil was obtained upon solvent removal (574 g, 91% yield). ^1H NMR (CDCl_3) δ 3.80 (m, 1 H), 3.39 (m, 2 H), 3.05 (m, 2 H), 1.87 (m, 2 H), 1.70 (br s, 1 H), 1.62 (m, 2 H); MS m/z 212.1 (M^+).

In a variation of the method described by Yarovenko et al. in *Bull. Acad. Sci. USSR, Div. Chem. Sci.* 1991, 40, 1924; ZnCl_2 (1 N in ether, 120 mL, 120 mmol) was added in a dropwise fashion
over 15 min to a magnetically stirred solution of step 1 (12.2 g, 120 mmol) and step 2 (12.6 g, 100 mmol) in ethyl acetate (500 mL). Precipitate formed immediately upon addition, and at a point the
25 stirring bar became immobilized in the matrix, requiring the reaction to be manually shaken for the remainder of addition. After standing for 15 min, the supernatant was decanted and filtered, and the residue was rinsed twice with ether, furnishing a hard white precipitate which was collected by filtration. The precipitate was identified via LC/MS as the intermediate *O*-amidinoamidoxime (m/z 229). This material was taken up in conc. HCl (50 mL), diluted to 4 N with EtOH (100 mL), and
30 refluxed for 1 h. Upon cooling, a white precipitate was removed by filtration, then the filtrate was reduced to 50 mL and diluted with 100 mL water. Solid Na_2CO_3 was added until the mixture was basic, CH_2Cl_2 was added, and the resulting mixture was filtered, rinsing with CH_2Cl_2 . Example 11: Protocol for RUP3 Dose Responses in Melanophores

Melanophores are maintained in culture as reported by Potenza, M. N. and Lerner, M. R., in Pigment Cell Research, Vol. 5, 372-378, 1992 and transfected with the RUP3 expression vector (pCMV) using electroporation. Following electroporation, the transfected cells are plated into 96 well plates for the assay. The cells are then allowed to grow for 48 hours in order to both recover from the electroporation procedure and attain maximal receptor expression levels.

On the assay day, the growth medium on the cells is replaced with serum-free buffer containing 10nM melatonin. The melatonin acts via an endogenous Gi-coupled GPCR in the melanophores to lower intracellular cAMP levels. In response to lowered cAMP levels, the melanophores translocate their pigment to the center of the cell. The net effect of this is a significant decrease in the absorbance reading of the cell monolayer in the well, measured at 600-650nm.

After a 1-hour incubation in melatonin, the cells become completely pigment-aggregated. At this point a baseline absorbance reading is collected. Serial dilutions of test compounds are then added to the plate and compounds that stimulate RUP3 produce increases in intracellular cAMP levels. In response to these increased cAMP levels, the melanophores translocate their pigment back into the cell periphery. After one hour, stimulated cells are fully pigment-dispersed. The cell monolayer in the dispersed state absorbs much more light in the 600-650nm range. The measured increase in absorbance compared to the baseline reading allows one to quantitate the degree of receptor stimulation and plot a dose-response curve.

The compounds in the above examples were screened using the melanophore dispersion assay, as described above. Representative compounds of the present invention and their corresponding EC₅₀-values are shown in Table 6 below. Certain other compounds illustrated in the Examples showed EC₅₀ activities in the melanophore dispersion assay of less than about 10 μ M.
